Public Synthetic Formula Regression Benchmark

$$f(x) = \frac{x^{2} + 1}{2y - 3}$$

$$z = \sqrt{u + v}$$

$$y(t) = a_{n-1} \ t^{2}$$

$$|x + 1| = 5$$

$g(x) = C$ on the branch of the initial point. The condition gives $K = 2^{-\frac{2}{3}}$. Cubing yields.
